

WHAT'S NEW IN 5.5?

Introducing Dartfish 5.5. Versatile, comprehensive, innovative, easy to use, fun. The new Dartfish 5.5 presents great enhancements to complete version 5.0. Meet the latest high-performance video analysis software.

> ENHANCED PUBLISHING TO DARTFISH.TV

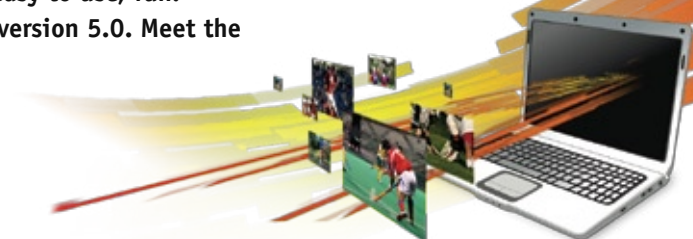

- **Uploaded videos trimmed to cue in/out markers**
By using the Player's timeline to set cue in and cue out points, you can control which segment of video is uploaded when publishing from the Tray. Previously, this was only possible from an Analyzer Storyboard.
- **User defined thumbnails**
A simple right-click on the Playhead lets you use the current frame for the thumbnail image to represent the video clip in the Library or on dartfish.tv. It is now easier for you and your dartfish.tv audience to identify a clip.

> NEW VIDEO CLIP CREATION FEATURES

- **Merge clips into a single video with Import From Camcorder**
Most HDD or memory card camcorders have a maximum file size and when your recording exceeds that, multiple files are created. The Import From Camcorder tool can now merge many clips into one during import.
- **InTheAction** once again allows **simultaneous capture from 2 camcorders**, now also in HD format.
- **Create slow-motion movies**
The Analyzer lets you save a movie of your Storyboard at a choice of play speeds.

> SUPPORT FOR NEW VIDEO FORMATS AND TECHNICAL ENHANCEMENTS

Dartfish continues to add to its support for video file formats created by the latest video devices. Different implementations of MPEG2 and MPEG4 used by devices such as mobile phones, solid state camcorders (eg. Cisco Flip) and still cameras (eg. Canon 500D, Nikon D90 and Casio Elixim High Speed, which create video) all have their own

technical demands. As an example, graphics card memory is now used more efficiently and the performance and stability of using HDV camcorders with InTheAction has been improved.

> BETTER VIDEO BASED PRESENTATIONS

When using a data projector or screen sharing software, a common problem is video not appearing on both the computer screen and projected image. Dartfish now offer a choice of using VMR9 video render technology to avoid this. The default setting remains VMR7 for backward compatibility with older computers but the setting can be modified in the advanced options.

> A WIDER DARTFISH WORLD

Launch of a brand new edition: **Dartfish Classroom Plus**. Classroom Plus has tagging and analysis tools and its edition offers an affordable notational analysis solution for schools, universities, or any organization with many Dartfish users. Its "concurrent network licensing" doesn't limit the installation of Dartfish to specific computers; the number of licenses purchased allows that number of simultaneous users on your network.

> DARTFISH NOW IN TURKISH

Software interface is now available for installation in Turkish.
